## Basic Usage

This is the main display for Quick Tab Switcher:

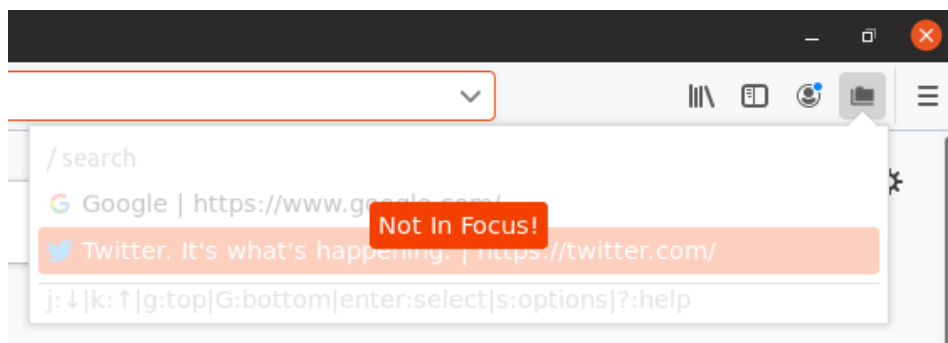

It displays the tabs that are open in the current window, with their favicons, page title and URL.

You can navigate with keyboard shortcuts (shown at the bottom of the popup).

- Pressing **J** or **↓** will select the next (below) tab, and pressing **K** or **↑** will select the previous (above) tab.
  - These will wrap around. (ex: Pressing **J** or **↓** on the last tab will select the first tab and vice versa).
- Pressing **g** will select the top tab, and **G** will select the bottom tab.
- Pressing **Enter** will switch to the selected tab and close the popup.
- Pressing **s** will open the [settings](#) for the extension.
- Pressing **?** will open this page.
- Pressing **/** will focus the [search box](#).

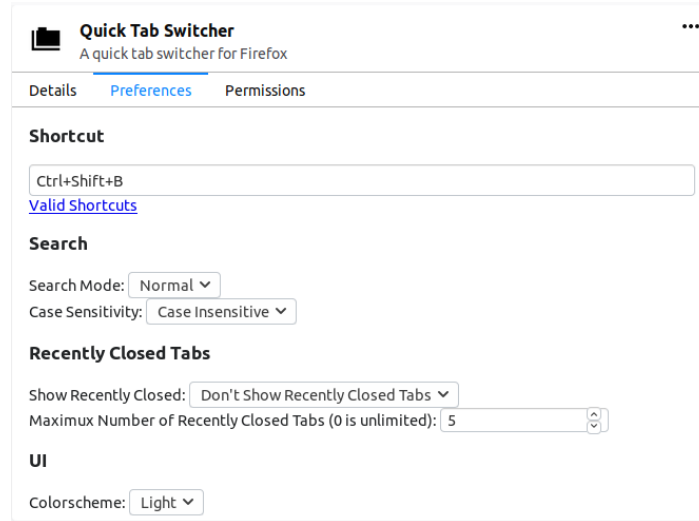

When the popup is out of focus, you can't use keyboard shortcuts. An error will show alerting you that the popup is out of focus:

When this happens, close and reopen the popup, or click inside the popup to focus it.

## Settings

The settings page looks like this:

## Shortcut

The shortcut option decides which keyboard shortcut opens the popup. It defaults to **Ctrl+Shift+B**.

You can see what makes up a valid shortcut on [MDN](#).

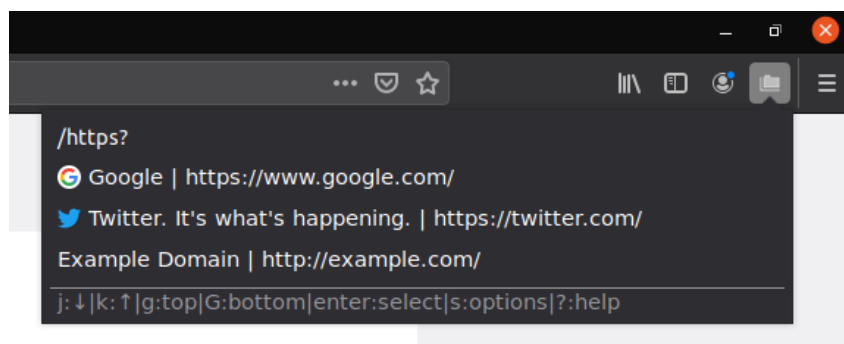

## Search

The search options affect how the search box in the popup works. The search is run on the page title and URL for each tab.

Press **Enter** after you enter your search term to put the cursor back on the tab list.

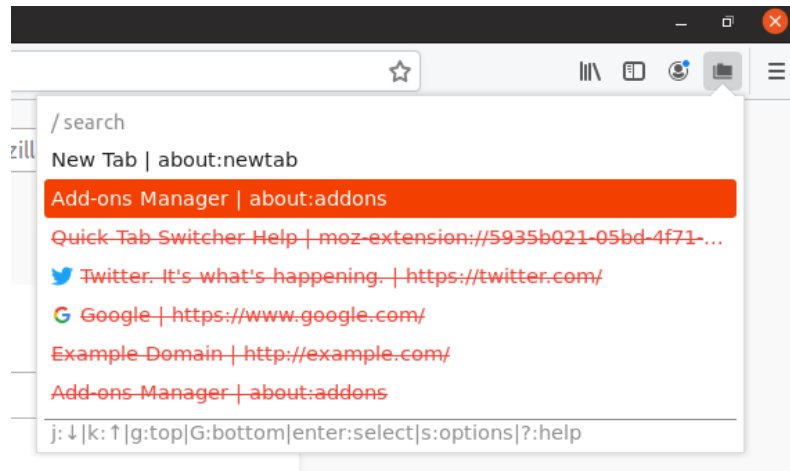

If search mode is **Normal** (default), it will show only the items that contain the search term. If search mode is regex, you can use [regular expressions](#) in your search terms.

Here is an example of the search (Regex mode) showing only tabs with **http** or **https** in the title or URL:

## Recently Closed Tabs

If you enable recently closed tabs, you can see tabs that you recently closed. They will be shown with ~~red text and strikethrough~~ to show that they were closed. Selecting one of these will open the tab again.

You can select how many recently closed tabs to show in the list at a time (Default 5). 0 is unlimited recently closed tabs.

## UI

You can select the theme of the extension. The light theme was shown above, here is an example of the dark theme:
